

## THEORY OF CHANGE

# Building a family operating system that serves underserved households at scale.

FamilyHub is a multi-tenant SaaS platform designed for households historically underserved by mainstream family-tech — the operating system for modern family life.

### THESIS

A family operating system, designed for households underserved by mainstream family-tech, enables those families to coordinate more effectively, evidences measurable learning gains for children, and produces a generation in historically-ignored regions with structured learning habits, household responsibility, and financial literacy — at population scale rather than in a small number of well-resourced homes.

## Logic model summary

|    |            |                                                                                                                                                                  |
|----|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01 | Inputs     | Capital, founder time, AI personalisation budget, secure cloud platform, community partnerships.                                                                 |
| 02 | Activities | Build the platform across 7 release cycles, operate the per-child personalisation engine, recruit families directly and via schools, mosques, homeschool co-ops. |
| 03 | Outputs    | Paying families, children active in learning modules, partner organisations live, sticker-economy transactions completed.                                        |

---

**04 Outcomes** Children learn what they specifically need; parents reclaim time; families coordinate without nagging; underserved households finally fit.

---

**05 Impact** More child learning hours that count. Less parental burnout. Equitable family-technology access. Community digital infrastructure where none existed.

---

## 01 — Inputs

### Resources and capabilities

- **Capital.** 12-month operating runway from grants, founder capital, then subscription revenue.
- **Founder team.** AI-augmented engineering, lean by design.
- **AI personalisation budget** for the per-child learning engine.
- **Secure cloud platform.** Approximately 70% built today; architectural decisions documented in internal records.
- **Community partnerships.** Islamic schools, mosques, homeschool co-ops, NGOs in UAE, Saudi, UK, Pakistan, Indonesia.

## 02 — Activities

### Operational programme

- Build the platform across 7 release cycles.
- Personalise Maths, Logic, and World Flags lessons for each child using their individual progress data.
- Recruit families directly (search, paid social, Product Hunt) and via community partners.
- Operate subscription billing: \$7.99–\$12.99 monthly for consumers; \$299–\$3,499 yearly for partner organisations.
- Operate a sticker economy that lets children **earn · save · invest · spend** — **financial literacy from early childhood**, real stakes inside the household.

### 03 — Outputs

## Quantified deliverables

| OUTPUT                                | YEAR 1 | YEAR 2 |
|---------------------------------------|--------|--------|
| Paid families (consumer)              | 1,000  | 5,000+ |
| Partner organisations                 | 15     | 30+    |
| Children active in 1+ learning module | 1,500  | 8,000+ |
| Modules shipped                       | 3      | 5+     |
| Geographies live                      | 2      | 4+     |

### 04 — Outcomes

## Medium-term change

| OUTCOME                                           | FOR WHOM                                         | HOW IT HAPPENS                                                                                                                                                                        |
|---------------------------------------------------|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Kids learn what they specifically need</b>     | Kids 6 to 14                                     | Per-child placement model targets the next problem the child needs.                                                                                                                   |
| <b>Parents reclaim time and mental-load</b>       | Mothers, especially                              | One dashboard replaces five apps; single source of truth.                                                                                                                             |
| <b>Kids learn money and responsibility</b>        | Children 3+                                      | Sticker economy — <b>earn · save · invest · spend</b> . <b>Financial literacy from early childhood</b> , embedded in everyday family life rather than a separate kids-debit-card app. |
| <b>Families coordinate without nagging</b>        | Whole household                                  | Shared calendars, assignments, notices, meals, with the right role-based access.                                                                                                      |
| <b>Underserved households finally fit</b>         | Muslim, multi-faith, blended, multi-generational | Ramadan journal, mosque integration, extended-family roles. Built in.                                                                                                                 |
| <b>Community organisations get a digital home</b> | Schools, mosques, co-ops                         | Their own branded family-portal in minutes. Community digital infrastructure where none existed.                                                                                      |

## Long-term impact

- **More child learning hours that count.** Personalised over generic worksheets, reward-coupled over chore-coded.
- **Less parental burnout**, especially on mothers carrying household admin by default.
- **Equitable family-tech access.** Muslim, multi-faith, and large-family households served with the same depth as the Western nuclear-family default.
- **Community-tech infrastructure** that mosques, madrasahs, and homeschool co-ops can run on without bespoke development.
- **A path to financial literacy from early childhood** — **earn · save · invest · spend** inside the family, not a separate kids-debit-card app. Financial inclusion that reaches MENA, Indonesia and Pakistan as a first market, not an afterthought.

## Critical assumptions

| ASSUMPTION                                                                                     | FALSIFICATION SIGNAL                                          |
|------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| Families in UAE / Saudi pay \$7.99 to \$12.99 monthly for an Anglo-Muslim-friendly family app. | Below 1% trial-to-paid conversion at six months.              |
| Per-child AI personalisation measurably improves learning outcomes versus generic placement.   | Learning curves match a control group after 90 days.          |
| Schools and mosques adopt the branded-deployment tier.                                         | Below 5 paid partner organisations by month 12.               |
| Children remain engaged with the sticker economy after the novelty wears off.                  | Below 30% of children weekly-active in the economy at week 8. |
| Per-family economics improve as the platform grows.                                            | The cost of adding a family flatlines or grows.               |

A theory of change is a falsifiable hypothesis. If a critical assumption fails to hold, the strategy is revised.

# Risks and mitigations

| RISK                                                                | MITIGATION                                                                                                                            |
|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Regulatory (children's data: EU GDPR, US COPPA, UK Children's Code) | Compliance built in from day one: automated personal-data redaction, no personal information in logs, parental-consent flows planned. |
| AI cost overruns                                                    | Per-child usage caps; batching and caching; target under \$0.50 per child per month.                                                  |
| Founder key-person risk                                             | Architecture fully documented; engineering AI-augmented and easily resumed; first hire focused on customer success or content.        |
| Conversion in cold markets (UK / US) underperforms                  | Phased launch: UAE / Saudi first, then expansion to the West.                                                                         |
| Competitor copies the four-pillar offering                          | Per-child learning data accumulates 6+ months of compound switching cost.                                                             |
